July 2026

Alchemity Announces Seed Financing to Advance its Single-Step, Thermo-Catalytic Reactor, for Producing Liquid Fuel from Waste and Stranded Gas

College Park, MD — Alchemity announces successful closing of a Seed Financing round backed by Blackbird Laboratories, Chesapeake Bay Seed Capital Fund, Discovery Fund, District Angels, Maryland Momentum Fund, Maryland Energy Innovation Accelerator through the Climate Technology Founders Fund , Resilient Earth Capital, and TEDCO Seed Fund.

The investment will support demonstration of a single step, liquid fuel production reactor system with zero CO_2 emissions. The core technology, a Shell Game Changer Awardee was developed by Eric Wachsman, and exclusively transferred from the University of Maryland and University of Florida to Alchemity, has already been validated. Alchemity is working towards a pilot-scale sustainable aviation fuel (SAF) reactor demonstration representing a pivotal milestone in the commercialization of its modular technology designed to convert waste or stranded gas (such as methane and CO_2) into high-value liquid fuels and chemicals. Alchemity intends to offer distributed fuel security at price parity to conventional fuels.

Bio-methane emissions and the underutilization of renewable gas resources pose significant environmental and economic challenges. Traditional methods used to capture and process biogas and landfill gas are frequently cost-prohibitive, inefficient, and carbon-intensive. Alchemity addresses these barriers using a proprietary thermos-catalytic membrane reactor that enables a modular, single-step conversion process. Deployed directly at the point of gas production, this technology transforms waste or stranded bio-methane and CO_2 into low-carbon fuels including sustainable aviation fuel (SAF), renewable diesel, and other valuable products, significantly reducing greenhouse gas emissions while optimizing local resource utilization.

"This investment allows Alchemity to validate technical performance at a meaningful scale and reduce commercialization risk by increasing the technology readiness and gathering crucial system operational data," said Emir Dogdibegovic, Co-Founder and CEO. “We thank the investors for their support and looking forward to putting our heads down and executing on the proposed efforts”, he added.

Alchemity recently graduated from the Creative Destruction Lab and received a Build Our Future Grant Award from Maryland Department of Commerce. Alchemity is poised to deliver

measurable environmental, economic, and financial impacts for the state of Maryland and beyond:

- **Environmental Benefits:** By converting waste biogas into low-carbon fuels, the technology directly mitigates localized methane emissions. Each subsequent commercial-scale system is projected to avoid tens of thousands of tons of CO_2 annually through active methane mitigation and the displacement of traditional fossil fuels.
- **Economic & Job Growth:** The expansion supports Maryland-based job creation across high-skilled sectors, including engineering, manufacturing, skid assembly, field operations, and project development. Early commercial growth is expected to create dozens of skilled jobs within the state.
- **Financial Value Creation:** The single-step waste gas to liquid fuel conversion process turns an environmental liability into a marketplace asset. By converting waste methane and CO_2 streams into marketable fuels and chemicals, the technology introduces lucrative new revenue opportunities for Maryland farms, wastewater treatment facilities, and landfill operators.

About Alchemity:

Alchemity is Seed-stage climate-tech company located in College Park Maryland. Backed by a strong intellectual property portfolio, and existing state-of-the-art facility, the company pursues a path to deploy a single step, distributed, liquid fuel synthesis reactors from waste or stranded gas with zero CO_2 emissions. With a mission to offer fuel security at price parity through distributed fuel production facilities, Alchemity is scaling a breakthrough technology allowing for lower overall Capex and Opex and eliminating the green premium allowing faster scaling and deployment of low-carbon fuels.

LinkedIn Post – more on vision (bold names will be called out/tagged)

🚀 **Alchemity** Announces Successful Seed Financing

Today marks an exciting milestone for Alchemity as we announce the successful close of our Seed financing round.

This investment will accelerate the commercialization of our proprietary thermo-catalytic, single-step reactor. The reactor system is designed to convert waste and stranded gas directly into drop-in liquid fuels and chemicals through a modular, distributed platform with zero process CO_2 emissions while offering drop-in liquid fuels at price parity.

🌎 Every year, vast amounts of methane are flared, vented, or left underutilized. Our vision is to transform these wasted resources (including CO_2) into sustainable aviation fuel (SAF), renewable diesel, and other critical products—bringing fuel production closer to where the feedstock is generated while reducing emissions and strengthening energy security.

We are grateful for the confidence and support of **Blackbird Laboratories, Chesapeake Bay Seed Capital Fund, Discovery Fund, District Angels, Maryland Momentum Fund**, **Maryland Energy Innovation Accelerator** through the Climate Technology Founders Fund, **Resilient Earth Capital**, and **TEDCO Seed Fund**.

This milestone follows our graduation from the **Creative Destruction Lab** and the award of the Build Our Future Grant from the **Maryland Department of Commerce**.

👏 Thank you to our investors, advisors, partners, and the entire Alchemity team for believing in our vision.

The financing is only the beginning.

Now it's time to put our heads down and execute.
